

Rodrigo S. Cruz Jr.
Blockchain Cadet

Laptop Model	Asus FX503VD.303
CPU: Intel Core i5-7300HQ	Intel Core i5-7300HQ
GPU:	NVIDIA GeForce GTX 1050 (2GB GDDR5)
RAM:	8GB
Operating System:	Ubuntu 18.04.1 LTS

For this activity we need to download and install the ff:

Installation of Hyperledger Fabric prerequisites

Open your terminal (Copy and Paste in this commands)

- `curl -O https://hyperledger.github.io/composer/latest/prereqs-ubuntu.sh`
- `chmod u+x prereqs-ubuntu.sh`
- `./prereqs-ubuntu.sh`

Install Node (in terminal)

- `nvm install v8` (To download and install node version 8)
- `nvm use 8` (To switch to node version 8)
- `node --version` (To check the version of the node your using)

Install Go Language

- Download Go for Linux in this url <https://golang.org/dl/>
- Go to the directory where the file located.
- Right click inside the folder and Open the Terminal
- Type "`tar -C /usr/local -xzf go1.11.5.linux-amd64.tar.gz`"

Add Go Environment variable

- `export PATH=$PATH:/usr/local/go/bin`
- `export GOPATH=$HOME/go`
- `export PATH=$PATH:$GOPATH/bin`

Install Docker

<https://www.youtube.com/watch?v=hY34PplIKf4>

you can follow the video steps in the video

Install the prerequisites for docker (in terminal)

- `sudo apt install \`
- `apt-transport-https \`
- `ca-certificates \`
- `curl \`
- `software-properties-common`

Installing the development environment for Hyperledger

Installing components (open terminal)

Step 1 : Install the CLI tools

Essential CLI tools:

```
npm install -g composer-cli@0.20.5
```

Utility for running a REST Server on your machine to expose your business networks as RESTful APIs:

```
npm install -g composer-rest-server@0.20.5
```

Useful utility for generating application assets:

```
npm install -g generator-hyperledger-composer@0.20.5
```

Yeoman is a tool for generating applications, which utilises generator-hyperledger-composer

```
npm install -g yo
```

Step 2: Install Playground

Browser app for simple editing and testing Business Networks:

```
npm install -g composer-playground@0.20.5 (latest version of composer-playground)
```

Step 3: Install Hyperledger Fabric

```
mkdir ~/fabric-dev-servers && cd ~/fabric-dev-servers
```

```
curl -O https://raw.githubusercontent.com/hyperledger/composer-tools/master/packages/fabric-dev-servers/fabric-dev-servers.tar.gz
```

```
tar -xvf fabric-dev-servers.tar.gz
```

```
cd ~/fabric-dev-servers
```

```
export FABRIC_VERSION=hlfv12
```

```
./downloadFabric.sh
```

To start hyperledger composer

in terminal type in

```
composer-playground
```

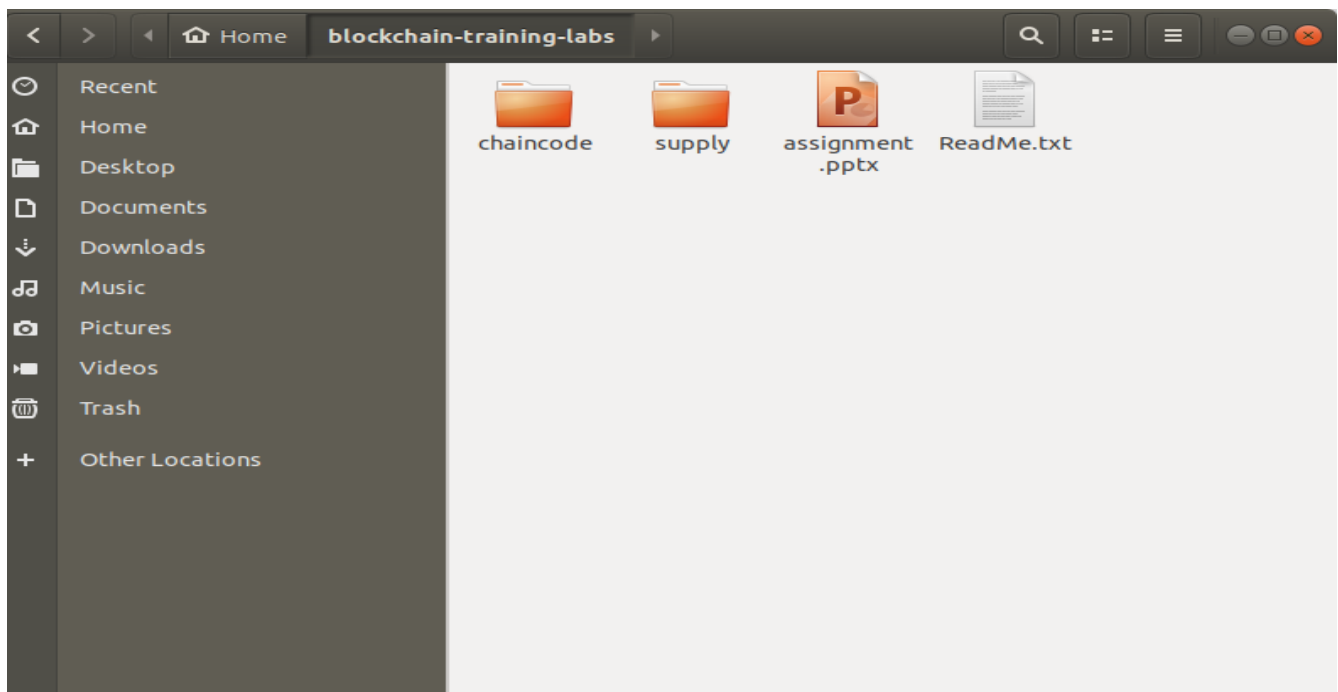

Hyperledger Activity Mandatory and Optional Assignment

Step 1. Clone the two repository from Github

```
git clone https://github.com/hyperledger/fabric-samples
git clone https://github.com/xjhuncruzx/blockchain-training-labs.git
```

Result : This will create two folders named **fabric-samples** and **blockchain-training-labs**

Step 2.:Open your **blockchain-training-labs**

Copy the **chaincode** and **supply** folder to your **fabric-samples** folder

Step 3: Type this your terminal , This will download the required library for your chaincode

```
go get github.com/golang/protobuf/proto
go get github.com/hyperledger/fabric/common/attrmgr
go get github.com/pkg/errors
go get github.com/hyperledger/fabric/core/chaincode/lib/cid
```

Copy **golang** , **hyperledger** and **pkg** to your **fabric-samples/chaincode** folder

Step 4: Type this command

```
cd fabric-samples/supply (Will move you to your supply folder inside fabric-samples)
./startFabric.sh (this will create peers for the network)
```

```
jhun@jhun-FX503VD: ~/fabric-samples/supply
File Edit View Search Terminal Help
jhun@jhun-FX503VD:~/fabric-samples/supply$ ./startFabric.sh

# don't rewrite paths for Windows Git Bash users
export MSYS_NO_PATHCONV=1

docker-compose -f docker-compose.yml down
Stopping peer0.org1.example.com ... done
Stopping couchdb ... done
Stopping orderer.example.com ... done
Removing peer0.org1.example.com ... done
Removing ca.example.com ... done
Removing couchdb ... done
Removing orderer.example.com ... done
Removing network net_basic

docker-compose -f docker-compose.yml up -d ca.example.com orderer.example.com peer0.org1.example.com couchdb
Creating couchdb ... done
Creating peer0.org1.example.com ... done
Creating orderer.example.com ...
Creating couchdb ...
Creating peer0.org1.example.com ...

# wait for Hyperledger Fabric to start
```

Step 5 npm install (install the list of dependencies)

Step 6 Update your chaincode

docker exec -it cli bash

peer chaincode install -n supply -v 1.1 -l "golang" -p "github.com/supply/go"

peer chaincode upgrade -n supply -v 1.1 -o orderer.example.com:7050 -C

mychannel -l "golang" -p "github.com/supply/go" -c '{"Args":[""]}' -P "OR

('Org1MSP.member','Org2MSP.member')"

Step 7 node enrollAdmin.js

Step 8 node registerSupplier.js

Step 9 node registerOEM.js

Step 10 node registerBank.js

Step 11 node app.js (to run the program)

Step 11 Open your postman (Testing if its working)

if you don't have postman (in the **Ubuntu software** search and download Postman)

Select and type in the url "localhost:3000/invoice"

choose the method GET click Send

This will let you push data to your postman

Step 12 Raise an invoice

Change the method from GET to POST

in your url change your localhost:3000 into localhost:3000/invoice

Click on the Body Tab

Select the x-www-form-urlencoded

Click Bulk and Edit

Copy these data values

invoicenumber:INVOICE001

billedto:OEM

invoicedate:02/08/19

invoiceamount:10000

itemdescription:KEYBOARD

goodreceived:False

ispaid:False

paidamount:0

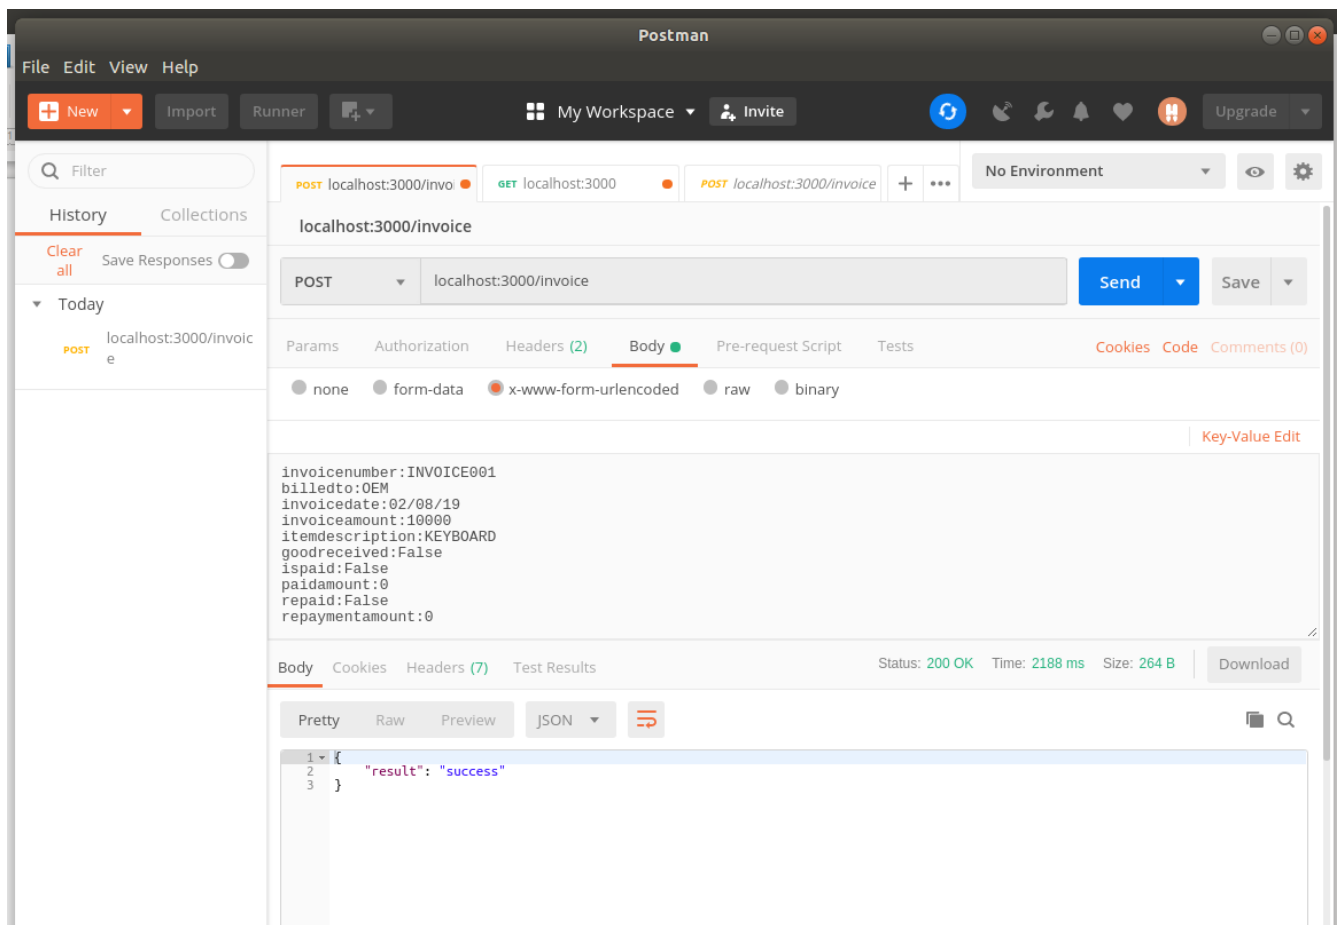

repaid:False

repaymentamount:0

Click Send

You will see the result: Success

Result: You have sucessfully raised an invoice

To view your invoice

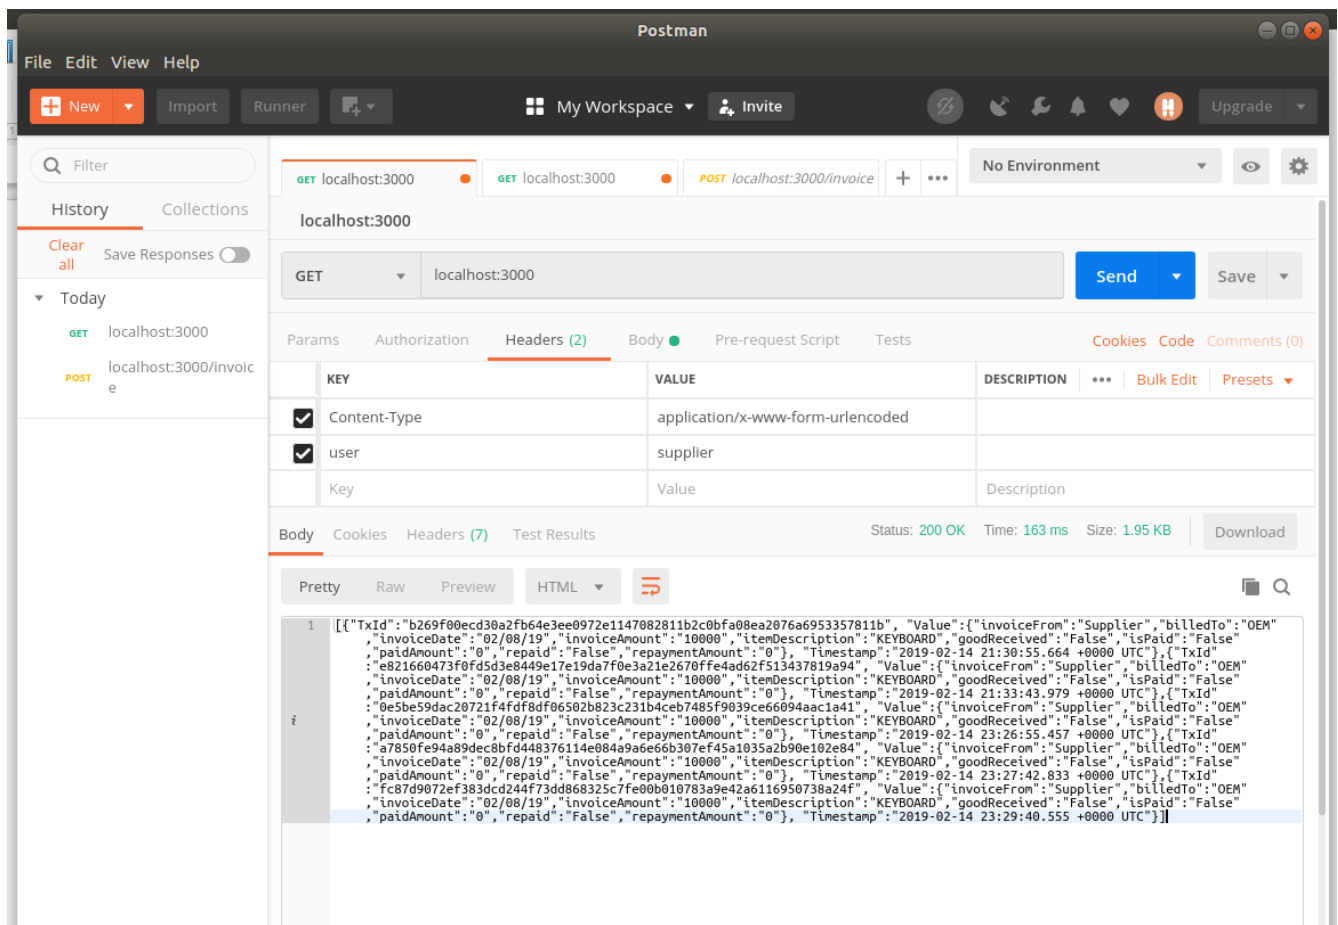

Select GET then type in your the url "localhost:3000/"

Select Headers Tab

Under the Content Type key, add the key "**user**"

Add the value "**supplier**"

Click the Send button.

Step 13: Declare goodreceived

Select PUT then type the url "`localhost:3000/invoice`"

Select Headers Tab.

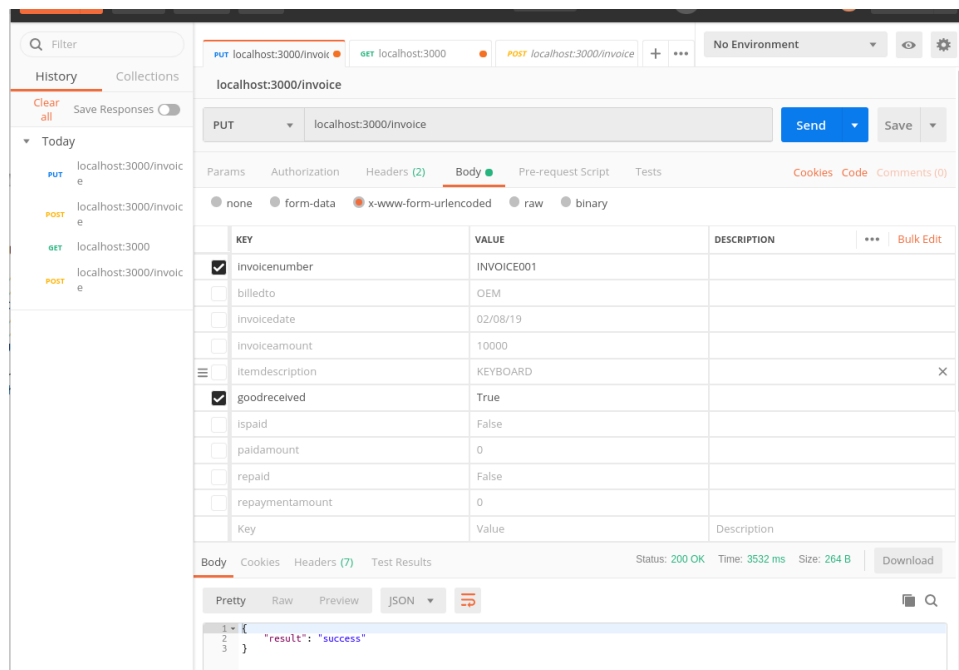

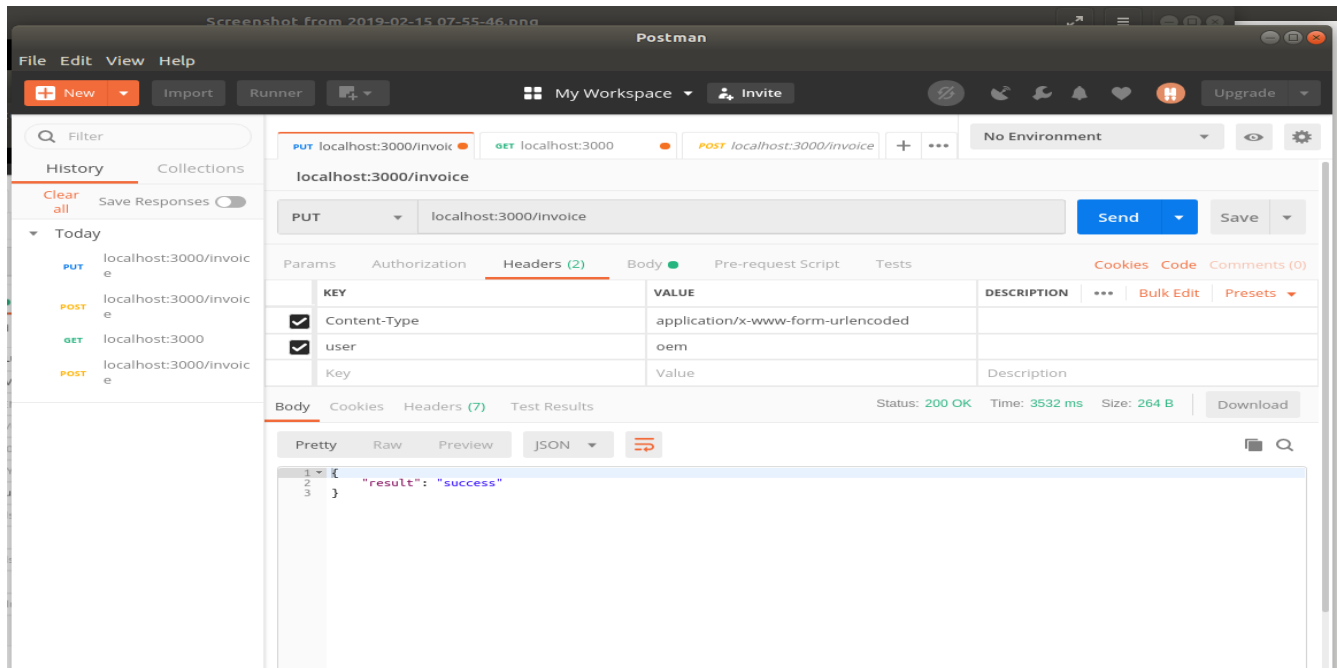

Change the value of user into **oem**

Select the Body Tab

Select the `x-www-form-urlencoded`

Uncheck everything except **invoicenumber** and **goodreceived**

make the value of **goodreceived** into **True**
then click send You will the result “**Success**”

Step 14:
pay the supplier

Bank will

Select PUT then type the url "localhost:3000/invoice"
Select Headers Tab.
Change the value of **user** into **bank**
Select the Body Tab
Select the x-www-form-url-encoded
Uncheck everything except invoicenum and paidamount

make the value of **paidamount** into **9000**
then click send You will the result “Success”

The screenshot shows a REST client interface with a PUT request to `localhost:3000/invoice`. The headers tab is active, showing two headers: `Content-Type` with value `application/x-www-form-urlencoded` and `user` with value `bank`. The response tab shows a 200 OK status with a JSON body: `{ "result": "success" }`.

KEY	VALUE	DESCRIPTION
<input checked="" type="checkbox"/> Content-Type	application/x-www-form-urlencoded	
<input checked="" type="checkbox"/> user	bank	
Key	Value	Description

```
1 {
2   "result": "success"
3 }
```

The screenshot shows the Postman interface with a GET request to `localhost:3000`. The response is a 200 OK status with a large JSON body. The response tab is active, showing the JSON data. The left sidebar shows a history of requests, including the current one.

```
1 [{"TxId":"c471ca3d3ec7927b50c1c8ed1ca09626654d94a089813e2b3a8f7a26ba5dbdf7", "Value":{"invoiceFrom":"Supplier", "billedTo":"OEM",
2   "invoiceDate":"02/08/19", "invoiceAmount":"10000", "itemDescription":"KEYBOARD", "goodReceived":"False", "isPaid":"False",
3   "paidAmount":"0", "repaid":"False", "repaymentAmount":"0"}, "Timestamp":"2019-02-15 01:43:09.803 +0000 UTC"}, {"TxId":
4   "5244a4dfdb57bdd75d8810fd85e95097db9ef3321c2ba89a67a8c8e85d1e92", "Value":{"invoiceFrom":"Supplier", "billedTo":"OEM",
5   "invoiceDate":"02/08/19", "invoiceAmount":"10000", "itemDescription":"KEYBOARD", "goodReceived":"True", "isPaid":"False",
6   "paidAmount":"0", "repaid":"False", "repaymentAmount":"0"}, "Timestamp":"2019-02-15 01:45:34.644 +0000 UTC"}, {"TxId":
7   "25bd8e14453f053fbd3821f351dc0ae1c43ef87a45fab75bdf1956c46821144", "Value":{"invoiceFrom":"Supplier", "billedTo":"OEM",
8   "invoiceDate":"02/08/19", "invoiceAmount":"10000", "itemDescription":"KEYBOARD", "goodReceived":"True", "isPaid":"True",
9   "paidAmount":"9000", "repaid":"False", "repaymentAmount":"0"}, "Timestamp":"2019-02-15 01:47:04.503 +0000 UTC"}]]
```

Check the data if changed
Use GET method then make the url into localhost:3000
Then click Send
The invoice will indicate **isPaid: True**
and the paid amount will be **9000**

Step 15 OEM will pay the bank

Select PUT then type the url "**localhost:3000/invoice**"

Select Headers Tab.

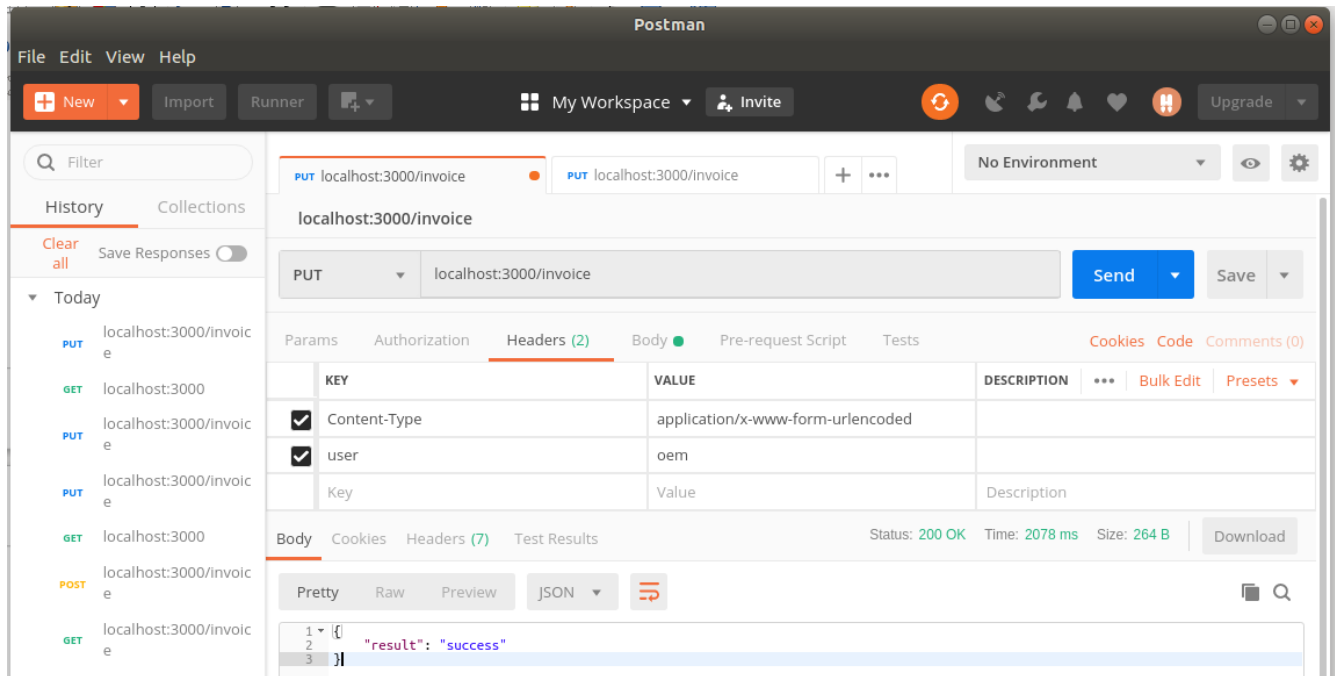

Change the value of **user** into **oem**

Select the Body Tab

Select the x-www-form-urlencoded

Uncheck everything except **invoicenum** and **repaymentamount**

make the value of **repaymentamount** into **11000**

Check the data if changed

Use GET method then make the url into localhost:3000

Then click Send

The invoice will indicate **repaid: True**

and the repaymentamount will be 11000

```

Step 16 Check Invoice Audit Trail

Select PUT then type the url "**localhost:3000/invoice**"

Select Headers Tab.

Change the value of **user** into **supplier**

Select the Body Tab

Select the x-www-form-urlencoded

Uncheck everything except **invoicenum**

Then Click Send

You should see the respond from the server change it from Html to Json format of the response
